GK_20 of KOR

The diagram shows a circuit setup. A large black circle on the left represents a 24V battery. A vertical red line extends from its center. A red circle at the top represents a 6V load. A red circle at the bottom represents another 6V load. A switch, depicted as a blue rectangle with a diagonal line, is connected in series with the top 6V load. The connections are as follows: the top terminal of the switch is connected to the top 6V load, which in turn is connected to the top terminal of the red line. The bottom terminal of the switch is connected to the bottom 6V load, which in turn is connected to the bottom terminal of the red line. The red line then loops back to the negative terminal of the 24V battery.
